## E.N.I.G.M.A.

## EUROPEAN NUMBERS INFORMATION GATHERING

 AND MONITORING ASSOCIATION

ENIGMA 15 Lhe journal of the kuromesn Numbers lnformation faltornide and Monitoring Association.
ENIGMA is a non-profit making association of listeners who monitor and gather information on 'Number Stations' and other related radio transmissions. ENIGMA aims to bring together listeners and enthusiasts and provide quality information on subjects not normally availabie from main-stream publications.

## Subscrintions.

4 Copies of ENIGMA -- are available for $\mathfrak{2} G .00$ sterling - includes postage for the UNITED KINGDOH.
4 Copies of ENIGMA - are available for $£ 10.00$ sterling - includes airmail postage for REST OF THE HORLD.

You may pay by Sterling Cash, US Dollars, Eurocheques or American Express cheques ( in Sterling) or by UK Cheques or Postal Orders payable to Mr C A Midsley.

## Contributions

He appreciate all contributions to the nowsletter (includins anonymous information). We regret that we are not always ablo to provide a personal reply but, rest assured, we read and collate all information for present and future use. Questions are answered via our " Letters to ENIGMA " pages. ENIGMA is also a discussion forum and we welcome comments about the newsletter. If you are interested in writing a feature please contact us at the mailing address.

May move to lower frequencies for winter months. All reports appreciated.
E3) LINCOLNSHIRE POACHER - Mode USB //E4
Transmissions continue between 10.00 and 22.00 each day. Starting at the top of each hour for 45 minutes. Three frequencies are selected from the list shown below. Jamming from Iran (?) continues to affect transmissions between $10.00 \& 14.00$ and between 20.00 \& 22.45. Jamming can be quite severe in Europe.
The frequency usage depends on message scheduling although two particular frequencies are only used once each week. These are 7755 on Tuesday at 15.00 (with 8464 and 10426) and 6900 on Saturday at 20.00 (with 11545 and 10426).
Full frequency list is 1647516084156821448713375126031154510426 92518464775573376959690064855746 5422. Recent reports have suggested that two transmitter sites are in use on Cyprus - BEMRS Station Zygi \& a further site at Cape Gatta. Comments welcome.

It was recently reported that a transmission on 9251 kHz was going on and off the air during the pre-amble. During this period a weak LP signal could be heard in the background. Two transmitters in use at the same time?
Heard with ID signal and no message, testing on 6968 at 13.50 UTC.
E4) CHERRY RIPE - Mode USB //E3
LP's sister station is still active using different musical marker. Recent reports over US transmitters based in Guam. Communications, however, also reported the possible use of a location in Singapore.
New frequencies have been noted in Japan, reception is difficult in Europe.

Tranamiasions follon Lincolnahire foscher format starting on the hour for 45 minutes. At present we are receiving reports of transmissions between 10.00 and 14.45 . I would suggest you try the following frequencies.
$1045211570138661446917499 \quad 20474123411$
He have also heard of one transmission at 20.00 on 4768 heard in Asia, this is not audible in Europe at this time.

All reports appreciated.
E5) COUNTING STATIONS - Mode AM //G5/E14
Still very active in English language.
Following based on reports received since last issue. Special thanks to Peter in SW. Schedules are short lived and prone to sudden changes. // Frequencies shown where known.

EG \& E7) ENGLISH MEN 'OOOOO' \& 'OOO 000' Mode AM //S6 \& S7 Families
See also our newspaper review "Russia steps up spying against Germany" in this issue. Still very active, I recently found one English Man in the middle of the Maritime CW (Coast Stations) band transmitting a 63 group message on 8546. They turn up all over the HF bands night and day.
Schedules are long and frequencies use seem almost random.
E9) MAGNETIC FIELDS Mode AM //V8
Unfortunately the weekly Monday transmission on $6645+/-$ at 18.00 seems to have ended. It did also have the habit of turning up sometimes at 19.00 instead but has not been heard recently.

Only one confirmed report SAT $09.20 \quad 11290$ It is possible that the station is still active at other times/frequencies.

See also v8 which is the sister station.
$E(D)$ PHONETIC ALPHABET -NATO Mode AM/SSB
Still very active indeed. We recently noted new call-sign Tango Mike Sierra (TMS 22) on 5339. At first I thought this was a new call as it did not appear on any of my own records or in documents in our files. But by a strange coincidence it turned up on a cassette tape we received of numbers station recordings from the late 1970's. So TMS is not quite a new call, just a very rare one.

We are preparing a feature about message strings (VLB 22D45D46E47) etc. for the next issue. I hope to be able to throw light onto these strange transmissions.

All information shown below is based on reports received since last issue. Some frequencies share call signs.

| 2270 | JSR | 2540 | VLB | 2743 | ULX | 2844 | YHF | 3090 | SYN | 3150 | $P C D$ | 325 | ULX |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| 7920 | ??? | 8127 | CIO | 8642 | CIO | 9130 | EZI | 9270 | RPA |  |  |  |  |

10125 SYN 10352 CIO 10820 VLB 11565 12747 CIO EZI 12950 SYN 14750 SYN 15016* VLB 17410 EZI. Drop in activity at +10 MHz .

* Reports of VLB still active on 15016 at 09.45 \& 10.45.

Other oddities include NDP-R \& NDP-X plus TMS-22. The longest ever message string from VLB recently was VLB 14B2Z156Z133Z140Z172Z117Z188. More on these in issue 12.

Also to end on this station. VLB was heard for a few days on 5530 at 20.00, on top of station E15 Nancy Adam Susan, VLB later moved to avoid interference.

E11) "OBLIQUE" Mode AM/SSB //S12//G11//M3
231 is still active and was last heard on FRI at 20.304780 moves between $306040154780 \& 5050$ depending on time or year. Try each Friday.

New 746 reported last issue seems to be in hiding. Last noted on TUE at 20.004015 and THU 20.303060.

All reports of this family very welcome.
E12 N N N Mode AM /M2
No changes to this station. Still active with excellent signal in Europe at following schedule.

```
MON 04.00 4573 WED 04.00 4573 THU 04.00 5821 FRI 04.00 4573
MON 21.00 4644 WED 21:00 4644 THU 20.00 5821 FRI 21.00 4644
```

Could any utilities expert please tell me who operates the signal which is on 4644 almost non stop in the evenings ? It would be interesting to know who operates this data mode signal.

E1A AF COUNT CONTROL. MOJE AM $\angle E 5$ CO5
No longer active.

E15 PHONETIC ALPHABET - pre NATO Mode AM/SSB

Reception around Greece reported to be good, can readers in this area please confirm, reception in UK very weak.

E16) THO LETTER (ENGLISH) Mode SSB //G16

Good news. Two reports received since last issue when we reported no traffic in English. Stations $A U$ - Alpha Uniform and MD - Mike Delta are still around.

AU seems to have a different purpose to other call signs in this set up. Transmissions from $A U$ are quite rare but unlike any others in this family they appear on $2 / /$ frequencies, usually 4821 and 4888. Transmissions always start on the hour and are repeated one hour later. Last ID heard was 192.

Mike Delta is also still around and more details can be found in Simon Masons column, along with latest operating schedule.

E17 ENGLISH LADY 'OOOOO' ENDING Mode AM
Still about but keeping a low profile this odd little station with its '00000' would suggest it is part of a much larger family, but we are not certain.

Likes the random approach to transmitting and appears without warning at the strangest of times. Only two reports received this time round.

```
23.30 5861 calling 932
16.00 7 MHz area calling 591
```

Looking back through old copies of ENIGMA this station has sent messages for :
$\begin{array}{lllllllllllllllllllll}124 & 168 & 208 & 274 & 276 & 347 & 372 & 482 & 531 & 561 & 636 & 657 & 893 \text {. Only } 274 & \text { seemed }\end{array}$ to ever receive lots of messages, the rest never seem to receive more than one message. What does this mean ? Do we really need to know?

## GERMAN TIAKGUAGE

G2) SHEDISH RHAPSODY Mode AM/SSB //H4
For detailed schedule please refer to issue 10. The folloring notes contain additional transmissions noted since issue 10 and also frequency changes.
He mould be interested in hearing from any reader who would like to take on the task of monitoring this station. We can provide special logging sheets for Snedish Rhapsody. The job mould be ideal for someone with lots of time and who enjoys complicated schedules !
CHANGES AND NOTES ONLY - THIS IS NOT A FULL SCHEDULE - USE HITH ISSUE 10.

| DAY | TIME | FREQUENCY |  |  | 1 | 2 | 3 | 4 | 5 |

Catch this station while you can, it could end soon!

## LLAVIC LANGUAGES

S2) DRUMS \& TRUMPETS - Mode AM /E1?/M17?
In May we were at last able to find the repeat transmission, the first broadcast takes place at 19.30 on 4740 with an immediate repeat at approximately 19.45 on 3410.
Unfortunately the expected transmissions on the gth of July and gth of August did not appear. It is possible that this station is still around but operating on a different date of the month. Any reports appreciated.
S6) \& 57) RUSSIAN MEN '00000' \& '000 000' ENDING Mode AM
S6) Family : E6//G6//V6//M14/S25
S7) Family : $E 7 / / G 7 / / V 7 / / M 12$
No major changes. Still very active on a wide range of frequencies. Schedules are very protracted and frequency usage and ID's prone to sudden change.
Possible daily transmission 57 at 05.00 for ' $813^{\prime}$ heard on 78839183 and 10383 (noted on 9193 on one occasion).
Also S6C sending single group messages include FRI 08.006934 sending message group " 11715 " and on WED 08.008830 sending " 22425

S6B format noted with two group message THU 18.006845 sending 203 846/2 $=1111100031$.
57 format noted sending 401 group message on MON June 11 to agent 283 and on FRI July 12 a further 401 groups to agent 642. A previous 401 group message was noted back in March 1995. What does it all mean?

S8) YT YT YT Mode AM/SSB //M27(BTV)
No changes to the $Y T$ operation. Reception should improve in Europe during the darker winter evenings.

MON 14.00 4755 WED 14.00 4755
MON $18.00-4425$

S12) CHERTA Mode AM //G11//E11//M3
Still active but like all family members is prone to sudden frequency changes.
Try 1st \& 3rd WED of Month 21.004015 or 5180 Call 971
Try 1st MON of Month $21.00 \quad 3823$ or 4465 Call 755
S13 \& S14) RUSSIAN COUNTING MEN/WOMEN Mode AM/SSB
S13) Not noted for some 'time, transmissions are only 2 minutes duration.

S14) Still a few around. Consists of a repeating loop tape which goes on for hours on end.

Recent logs have included:

| MON | 19.00 | 4330 | Male in AM |
| :--- | :--- | :--- | :--- |
| TUE | 19.00 | 3875 | 'GORA $43^{\circ}$ |
| FRI | 22.00 | 4064 |  |

S16) OLX Mode SSB, Morse Call Up, and //MG OLX
Still operating 23 hours per day - The Czech Secret Service are busy!
Transmissions start at 5 minutes to each hour for about 20-40 minutes. About 50/50 Morse and voice messages.
To make listening even simpler they are at present using only the following frequencies.

$$
\begin{array}{llll}
\text { Daily } & 17.00 \text { to } 22.00 & 5301 / / 9320 / / 11416 \\
& 00.00 \text { to } 04.00 & 5301 / / 9320 / / 11416 \\
& 04.00 \text { to } 18.00 & 8142 / / 14977 / 18303
\end{array}
$$

It would be interesting to find out if all 3 transmitters are situated inside the Czech republic. I suspect that at least one is not ?

May change frequencies for Winter.
S17) CZECH LADY "CONTROL" Mode AM
Again no changes to this station.
Daily`13.55 to $14.024485 / 5027$ - single $5 F$ message.

S18/19) CZECH MAN Mode AM
No reports received.
S21) RUSSIAN LADY Mode AM //M45
Still quite active, although we have not received many reports this time round.

| HON | 19.45 | 5290 | Calling 491 |
| :--- | :--- | :--- | :--- |
| TUE | 17.40 | 5740 | Calling 342 |
| THU | 17.40 | 5740 | Calling 342 |
| THU | 19.45 | 5290 | Calling 491 |

S25) RUSSIAN MAN "CONTROL" Mode AM/S6 Family
Daily at 08.00 on 14890 ID always 615. 08.20 on 11270*

May not move here if 08.00 message is non - standard. i.e. S25A/B. 11270 may or may not be used thereafter.

## OTHER LANGUAGES

D2) SPANISH LADY 2 or 3 FINALS Mode AM//M8
For full schedule details please refer to issue 10. Stations still very active, particularly during period 03.00 to 09.00.

『5A) COUNTING - SPANISH $4 F$
Just one report received.
MON 03.006803
V6) SPANISH LADY '00000' ENDIHG Mode AM //S6 Family
Part of the S6 Family.
Likes random times and frequencies but gives a strong signal in Burope.
Likes FRI at 20.00 and 21.00 Calling 834 Frequencies seen random but have included $80571146712210 \& 13551$. Nill drop lower for winter months.
V7) SPANISH MAN ENDS '000 000 ' Mode AM //S7 Fanily
Part of the 57 Family.
In May call ' $212^{\prime}$ becane ${ }^{\prime} 273^{\prime}$ and still is. The station changes frequency each month and recent logs include : -
TUB \& THU at approximately 06.20 May 9062 June 9142 July 9109 Also a one off transmission was noted on THU at 06.30 on 6780 for - $519^{\circ}$.

V8) GASTERN MUSIC STATION Mode AM/BO
This station is related to $E 9$ the 'Magnetic Fields' outfit. The language used by $\nabla 8$ may be Arabic. It is possible that the aessage is aade up of groups mhich are read out in an unusual manner.
Noreal reading of the numbers 41190 would be FOUR ONE ONE NINE ZERO
This station may read the numbers FORTY ONE - ONE HUNDRED \& NINETY.
Which in Arabic mould be read HAHID HA ARBAEEN - MEAH WA TESEEN.
This may account for the unusual format.
Single Numbers in Arabic are - (1) Hahid (2) Ethnain (3) Thalatha
(4) Arba-a (5) Thamaiab (8) Sab-ah (6) (4) Arba-a (5) Khamsah (6) Sittah (7) Sab-ah (8) Thamaniyah (9) Tes-2h.

Transeissions seen to take place on the first FRI and first SAT of the month.

| 1st FRI | 08.20 | 11290 | $+/-5 \mathrm{kHz}$ |

X6) The 6 Tone repeating stations are still very active. No schedule has ever been established. Sone transmissions have been known to repeat within the hour.

It is well worth staying on the frequency once the 6 tone $A M$ signal ends. On odd occasions a short string of morse is sent folloned by an FSK message. This sometimes occurs about 30 seconds after the 6 tome signal leaves the air.

In Kay me wrote to the Swisa PTT concerning HEP, the reply can be seen on the next page.

Direction General De L'Enterprise Des PTT, Viktoriastr.21, CH-3030 BERNE, Switzerland.

Dear Sir, represent the ENIGMA Newsletter, a non-profit making I represent the ENIGMA and gather information on radio association of

I would like to ask if it would be possible to provide us aith information on a station which uses the call-sign HEP. This call-sign is allocated to Switzerland under the International Allocation of Call-Signs.
The signal sent in C.H. with the call-sign HEP operates 24 hours per day on 331452686871 and 3186 kHz using a 1 minute cycle.
Would you please explain the location and purpose of this signal in order that we can inform our readers.
If you also have a contact address for station $H E P$ this would be most appreciated.
Thank you in anticipation of your reply.

Yours Faithfully,

Chris A. Midgley for ENIGMA Nensletter.
May 20th 1996.

## MORSE STATION NEWS

As usual, there's a lot to report - far more than can be put into a few pages, so the notes below are only intended to give a general summary of morse activity over the past few months. It is very difficult to say whether this activity is increasing, but there is certainly far more of it than voice. Often there may be four or five morse stations operating at the same time, and this could apply to almost any time of day. Keeping up with all this is an enormous task, which can really only be done properly by dedicating our monitoring to particular stations and adopting a more systematic approach, adapted specifically to the habits of those stations. The following notes can only represent a sample of what is actually happening out there; all kinds of news must slip the net - far less likely with voice stations.
M1 In this issue I have included a list of all my logged M1A/B (end-of-month) transmissions, which clearly shows how varied they can be. It isn't always possible for me to log all three of these each month, so any help over this would be very welcome. Daily transmissions of similar format have been reported by Costas in Greece at 1020 on 5638 but so far we haven't been successful in receiving these in England. We wonder where else in Europe these can be heard - please let us know - with logs of complete transmissions if possible. It is interesting to note that element $F$ is confined to Thursday 2000 only - as you can see, three groups were sent on 30 th August - a record number. The $A$ network schedule will change for September and Dctober: Schedule Number will be 463 - Sun 0700 6508, Tue \& Thu 1800 5474, Tue \& Thu 20005017 and Sat 15006261 kHz .
Several $B$ network schedules have also been noted over the last few months: Sat 16055321 kHz 053 (typical GC: 30 ), Tue 1440 5967 kHz 441 (30), Thu 07055247 kHz 507 (30)-fortnightly, Fri 20054027 kHz 293 (30), Mon 1510 5350kHz 638 (15). Most of these operate weekly and schedules are prone to sudden change and bear no relation to the rigid habits of the $A$ network. No doubt there are more of these around - they can only be found by chance.
M3 At present all activity seems to be confined to the lower frequencies ( $\langle 7 \mathrm{MHz}$ ). Those in use April to August are: 4901, 5090, 5180, $5360 / 5,5520,5550,5625,6850 \& 7256$. This last one by 552 in May but has now ended. IDs using the higher freqs (up to 10720 kHz ), the $50-$ and $55-$ clusters are not active, however, they're likely to return without warning: This station, like its voice counterparts is in a constant state of flux and changes take place with bewildering regularity. Publishing details would serve no useful purpose! IDs active: 011, 016, 017,.018, 019, 040 (new), 041, 042,043,

044, 049, 282 (new but part of known cluster), 552,621 \& b24 (new). Activity is still very much confined to the 05000 0930 period, however, two new evening slots have been found: 282 on Mon \& Wed at 2045 (a most unusual time - if they're going to make a habit of this it won't help us!) on 6850 ano 624 on Thu at 2030 on 5635. I don't know yet how frequent these transmissions are. Group counts since May show their
 typical sample. Messages seem to appear in flurries for several IDs together - all with similar GCs. A most peculiar operation. See also El1, G11 \& S12.

M7 Its new and irritating habit of dispensing with the 10 minutes of rapid dashes make this station's ID difficult to catch, for we only have one minute of 'tone sequence' followed by the ID three times. If we find the transmission within this period we're lucky, especially seeing that it favours intervals between hours. Recently I've noticed the usual strings of rapid dashes on habitual M7/M1O freqs followed by long periods of silence ( $15-20$ mins). These are good indicators that either M7 or M1O will eventually appear on that frequency - if MCW, M7; if ICW, M1O. Once schedules have been determined, then by monitoring the correct frequency, ready for the expected time, is the only sure way of cateming M7's ID. Much more work needs doing to establish: 1 - these stations schedules and scheduling habits more precisely, 2 the possible explamations for M7's unique tone sequences', 3 - whether there is any pattern in the (occasional?) sending of identical messages on both stations.

M10 See also above. Very active. Many multiple messages sent, and often much longer than in the past. i.e. 2 messages of 40 and 51 groups, 3 messages of 31,42 and 50 groups etc. More freqs are also being used. Active IDs: 049, 084, 123, 159, 193, 253, 357, 371, 374, 408, 435, 497, 684, 695, 752, 763, 820, 966, 983. On Wed 22.5 at 0630 on 6780//5301 the first message (to 357) had identical decode key and group count i.e. $35735735719191919==$, the first time I've noticed this with any numbers station.

A second variant format, M10B, occurred on Mon 22.7 at 0820 on 8165//9455 but unfortunately I missed the beginning of the transmission. It ended with several 5 F groups, and instead of the expected $==$ DK DK GC GC there was a pause of about 30 secs followed by 111 000. This schedule operates two weeks per month for 253, and repeats on the next day, same time \& freqs. However, this variant was not repeated on the Tuesday and a standard transmission was sent. This probably indicates that the agent had sent a message back in the intervening period. It is likely that Monday's message ended normally, and an
operational code of some kind followed (e.g. J3J) then an additional short message was sent without DK or GC. It was clearly no longer necessary to repeat this additional information the fallowing day. M1O is now worth monitoring all the way through to the end, as is also M13 just in case they turn out to be $B$ variants. M7 and M10 may be Slovak as oppose to Czech operations.
M12 Extremely active as usual. IDs since April: $121 \quad 125132$ $\begin{array}{lllllllllllllllllllllll}139 & 142 & 151 & 188 & 213 & 214 & 216 & 234 & 254 & 257 & 260 & 303 & 304 & 315 & 318\end{array}$ $374 \quad 418 \quad 462 \quad 479 \quad 511 \quad 519 \quad 605 \quad 638 \quad 643 \quad 658$ (very busy) 739 749 (another one with heavy traffic) 785941 \& 999. Triplet IDs are very rare, the only other I have ever logged being 888. 999 only popped up once (?) on 14.5 with a DK of 9001.

M13 It now appears that this station is the morse counterpart of a group of extinct voice stations: E18 - Simon Mason's "Fife Free", 54 "Edna Sednitzer" of indeterminate Slavic language, and G22, its newly-discovered German equivalent. It is possible that M13 was phased in to replace the voice stations. Of all known M13 IDs, their serial numbers (unique to this station) would indicate that they all originated within 33 months of each other. We really need early logs of this one for they could determine the precise month of birth' of M13, at least in the form that we know it today. The 'youngest' ID, 865, would be 144 months old in December, assuming that its first serial number was 001 . On the other hand, these numbers could begin at, say, 100 , which would make 865 theoretically 44 months old, in which case it looks very likely that the morse station has superceded the voice networks. Whatever it is, it is some country's primary number station, and is active several times daily.

On 20th May (1900: 10244kHz) a 50 group message was sent to 590. This is a very high GC for M13 which nearly always sends 20-30 groups. Their often non-random nature can be seen from looking at this particular message, which began, 07080 05002, and ended, 0015005009.
M14 Very active as always. IDs since April: $147 \quad 168193292$ $\overline{397} 571614623 \quad 631671672691613951$. On 7th June the lowest recorded GC appeared: 14 to ID 672. On 8th August a two message transmission (very rare) was sent to two consecutive IDs: 361-791/48, 362-451/97. (1900 4973kHz)

M20 I now realise that there are two distinct $V$ stations. One is a form of M23(one form of many); the other seems to be quite unconnected, but shares features with MJ - it always uses MJ freqs., sometimes preceding a MJ transmission within 20 minutes or so. Its ending is identical to $\mathrm{MJ}^{\circ} \mathrm{s}$ i.e. $==$ 000. It has never been known to send messages and its only other characteristic is a continuous string of $V s$. It is by
no means easy to find, and my only logs in the past few months are: Thu 20th June 0820 5550, Thu 27 th June 08405520 and Wed 7 th July 20505180 kHz . (all regular MJ freqs.)
M23 Although at present dormant, M23 went through one of its inexplicable frantic bursts of activity from around late April to the end of July. Whenever operating, transmissions are daily, at same time and on same parallel freqs. Several overlapping networks operated over this period. As an example, one of these used a 2000 slot on $6918 / 16920 \mathrm{kHz}$. From 2nd May (or earlier) it sent a daily null message, using the arbitrary all-odd ID, 359. On 22nd May, the all-even ID, 268 resulted in a 34 group message. This same message was repeated daily for exactly a month finishing on 22nd June. There was no transmission on the 23rd, but from 24 th June to 2nd July a 29 group message was sent (call 268 again). After this date this network ceased. Other networks operating during this period were to be found at: 0800 10775/111346, $10008307 / 16869$, 1200 8307//6869, $13006918 / 16290$ and 1700 at first 6918//6920, later 8307/16918. Calls used (all merely as message or no-message indicators) were as varied as usual: 111, 666, 000, 11111, 00000 and 55555. First and last groups are always identical for each message, and always of the form $0 x \times O x$. The penultimate group is also always significant - it always contains a zero, and is usually of the form $x \times 000$. A most interesting and entertaining station.
M25 KKN5O is still around - I heard it for the first time in many months on 14 th August at 0500 on 6923 kHz . (call only)

M26 The "98 Station" returned after a long absence as predicted, however, it's not living up to its name any more. On Wed 14.8 I came across it at 1940 on 5196 . It was being much more adventurous than usual. Its ID (for want of a better term) avoided the use of 98 for the first time, opting for 99, 95 and, most unexpectedly, 68. Its 'message' also departed from the usual 17111 etc. style. Here's a sample of its tedious output: 99 50524, 95 12345, 68 10524, 99 10524, 99 00510, 9512345,9900534 etc. This sort of stuff went on for hours as usual. As I half-suspected, 99s, being closest to 98, predominated. 955 were always followed by 12345. Rather pointless, I'd have thought - but who are we to judge the meaning behind their madness?
M29 VDE not heard since July - could easily still be around though. Messages were daily, commencing on Monday and remaining the same all week, being replaced each Monday. The first transmission went out at 1700 , being repeated at 1900. Just like G4, freqencies changed at the start of each month. For the record, these were: April 1700 not known, 19004620 , May 1700 4869, 19004640 , June 1700 5120, 1900 4770. On

Friday $215 t$ June a 1700 transmission was reported on 5405 another network?

M33 P8K still following the same schedule. One of our contributors has been sending in meticulous weekly logs of this station. There is enough material to form the basis of an article on POK's habits and idiosyncracies, some of which have similarities with FDC. PBK is almost certainly operated by French intelligence. Transmissions always consist of six messages - five letter messages are sent one day and five figure messages the next, constantly alternating in this way. The two different types of messages would seem to have two different purposes - only the letter messages are preceded by date/time groups. Still to be found on 6960//5760 daily at 1900 \& 2000. An article will appear in the next issue. Many thanks go to Guy of Portsmouth for his dedicated monitoring.

M39 Like M23 and M26, this is another occasional station. Each time it appears it always uses a different 3F ID. It has similarities with 525 in that one ID is associated with several single $5 F$ groups. A typical format would be: 746746 746200322003220032 (repeated several times, then a sudden break into a string of dashes, then...) 74674674622749 2274922749 etc., 746746746913139131391313 (ending with a final burst of dashes). This was the transmission on Thu 9th May at 0800 on 6936. Others logged: Thu 23.507005027 93749125..... Fri 25.5 06005017 191-62845,98886,14759,60453; Tue $11.619005530 \quad \therefore . .864-95037,38733$; same date 2020 648$0 \times x \times 8,84026,08752 ;$ Wed 14.809005110 ....421-68237,95046; Wed 21.8 08005047 ....297-34003,61428.... Not all of these logs are complete as I felt there were more interesting things to listen out for! The examples give a good idea of the extreme randomness of this station, both in scheduling and in content. Any logs would be appreciated.
That's all the morse news this time round. Don't forget that just because a station isn't listed above it is no longer active. Active morse stations following their usual habits and schedules not mentioned above include: M2, M4, M6, M8, M16, M17, M18 (still on 4502), M21, M22, M24 (included under M14), M27, M28, M31, M32-style networks, M34 - not heard over past few months, M42, M43 \& M45.
MX SLHFM activity is much the same as last time. One night I counted 19 operating at the same time! In August the ' $R$ ' marker on 3196 had a brief flirtatation with 6390 kHz , then after a few days at the most, returned to 3196. During this period its companions on $3323 \& 4325$ remained where they were. The relatively new 4325 marker seems to have taken up permanent residence there. At around the same time the 3323 ' $R$ ' developed a bad chirp similar to that of the plaintive-
sounding 'L' on 3091, which has suffered from this complaint for years now, on that frequency. It is not unusual for these 'markers' to move to widely different frequencies: 3323 moved from 7452, and the ' $V$ ' at present back on 3174 , moved there a couple of years ago from 9162 kHz . What does all this mean?
' $P$ ' markers, and the solitary ' $C$ ' markers tend to be shortlived and are often followed by a few groups in morse and a short burst of FSK RTTY. The others, including the clustered ' $C$ ' and ' $S$ 's never seem to do anything but bleat out their "ID" for 24 hours a day!

## ADDITIONS AND ALTERATIONS TO CHECK-LIST

```
EGA - 2 group commencing 11111
E2O - 2 message, dual voice version of either E17, E6 or both.
All these could be variants of the same station.
E21 - 4F counting, English accent
    A - American accent
G5A - "Zwei" variant
G8B - Rapid dots intro.
G9 - Change to 'Saxaphone piece' (G20 includes Jazz Players!)
G13 - 3/2 group variant
G14A - non-phonetic variant
G15A - PN read over notes
G2O - "Spruch"
    A - one 5F group
G21 - Music and morse
G22 - "Edna Sednitzer" - German version
G2J - 2ME, Hitler's birthday (Langley Pierce)
S2C - 3F Nomer, then reversed
    D - 5F Nomer
S2B - delete: see XI
S6C - Continuous 5F
D - ID + 111
E - two message
    F - 00000 00000 ( a possible error)
SiOB - five note intros. (3 versions)
S17A - no circuit number, positioning index or group count
            B - 01 GC
            C - 313-5F
524 - delete: a variant voice of 56
s28 - "Zyt! Zyt!" ("Hush! Hush!") - Polish language
V1A - with additional tune
V17 - Romanian 3F + 000
V18 - NNN Hungarian
V19 - WTR21 ("Don't Cry for Me Argentina")
M1OB - extra groups, ends 111 000 (complete format not yet
determined)
M24 - delete: same as M14, but with long end dashes
M48 - "Ciocirlia" morse version
M49 - G8A morse version
X1 - Bugle (formerly S2B)
```

                                    FULL LIST WITH NEXT ISSUE
    MI2 - THE 14403 KHz NETWORK (concluding part) - by M.G.
In ENIGMA Newsletter 9 , we introduced the highly complex Russian morse net, M32. In this feature, the transmission structure itself will be analysed.

Each message consisted of up to ten elements, excluding the call: A - a random 3F group, probably the decode key. B - a 2 or $3 F$ group representing the approximate group count. $C$ - a $2 F$ date group. (date of message origin). D - a $4 F$ time group, always between 0800 \& 1400 and timed to the minute (office hours?). It bore no relation to time of transmission, so probably indicates time of origin of message. $E$ - a repeat of the decode key. F - an optional Z-code group, those used in the sample being: ZLA, ZAY, ZGF \& ZOU. G - a JF group which is occasionally identical in two cosecutive message transmissions - probably the link number. $H$ - an optional ' $p$ ' group consisting of 3,4 or 5 Ps. This may indicate reply priority or message urgency. I - the $5 L$ message proper. J either ending $A R$ or a further $3 F$ group followed by 'K'. i.e. reply. This group is related to the date of origin, and is identical for 2 or 3 messages together. It is probably an encryption key for encoding the recipient's reply. In the single case where a reply was not required, this group was not sent. Break codes ( $=$ ) were sent between elements $E$ \& $F, G$ \& $H, H \& I$ and $I$ \& J.

A most bizarre peculiarity was the group count given which in only one case was correct! Deviation from the correct number of groups varied between +9 and -10 . There is no doubt that the 2 or $3 F$ element ' $B$ ' was related to the group count, as in all cases true group counts were high relative to this deviation. (over 100 in most messages). Short of the operator/s being accused of miscounting on 19 out of 20 occasions, I can only conclude that these approximate group counts are not errors. But why send them deliberately?

Here is the first message, as it was sent on 24th Sept 0703:GDTU GDTU GDTU DE HRHG HRHG HRHG QTC $K$ (sent $S$ times, the last time without the K) $867180241004867=$ ZLA $499=\operatorname{PPPPP}(189$ SL groups followed, not 180 ) $=200 \mathrm{~K}$

| 967 | 149 |  |  |  |  |  |  |  |

All serial numbers are projected to December 1996, whether IDs are active or not. IDs cover the period July 93 to July 96. Where alternative times are given for the same day these may either refer to seagnal change or two separate transmissionson same day.
( 000 ) indicates ID's known to use MBA format also.

## Letters to E.N.I.G.M.A.

Heloume to faran 11, congratulationa if you gpottad our deliberate aistake in issue 10. Yes ne forgot to put a 10 on the cover. Sorry.
We have had lots of great letters and coments and it is difficult to know where to begin !
First a fer coments about issue 10. Hixed viens continue to be received. From Osmestry in Shropshire comes the comment that ENIGMA should cover a smaller number of stations but in more detail. Meanahile Alan in Solihull preferred the layout of issues $1 \& 2$ which he describes as more 'eye catching'. Another valued reader says 'a clearer type face might be better as I am not as young as I was in the Cold Har ${ }^{\prime}$ !
But on the other side of the fence is Jonathan in Zimbabre who says the printed format is very good and I guess a lot of inforation can be packed in this ray'.
We are trying to keep a close eye on the type face, on the question of content EMIGMA continues to gather more and more information. He are keen to give you a comprehensive neasletter aith accurate information.

Another subject which carries strong opinion is that of station names. Back to Ospestry I don't find the Nensletter as easy to follor nowadays, having started nith issue No.4. The descriptions such as M10 or G8 don't mean much'. Also Lars in Germany asks for an explanation of the codes.
Mike in Kent also writes : 'Pet names'. I hope you do not decide to dispense with the inclusion of these, the ENIGMA numbering system is a good one and ideal for our computerised data bases, but not having a 'pet' nane will be like losing an old friend to those of us who have been 'at it' for years. You cannot allow then to be dehumanised and de-ronanticised into a code number.
Bren ner stations appear more alluring with a pet name eg ; Cherry Ripe and Bright No Ha. Where's the romanticism in B4 \& V9.
Let me try and clarify, first voice stations. Faced gith a huge anount of both historical and current information we had to find a Fay of getting it under control (I cannot take the credit for this). Folloving the lines of the professionals we introduced a language based coding system, this aas then split further by fornat type. He do not include "different' voices used by the same station over a period of tine.
So, this ras the starting point. It is not our intention to thror out all the old "pet names" but to ansign alons. So hich have an identiriable reanain alongside s3 the ner desiga part of the station which can be used for identification purposes. Things that are of no use such as Bulgarian Betty are both dangerous and misleading. The station is not Bulgarian and her name rould seem unlikely to be Betty !

I asfer that a man atationa nom certain cases it is the safest For example ; if you are not For example ; if you are not familiar mith certain German language stations ahich sound pretty similar then the "endings" 00000 or 000 000 will make all the difference betmeen G6 \& G7. Morse stations are an even bigger problem with so fep clues. Making up an ever increasing proportion of traffic the task of sorting out one station fron the other is very difficult. The norse format charts are the best may ae can come up nith, to help in making a correct identification.

So I hope that is of some help and reassurance. He pant you to enjoy BNIGMA and pe are not trying to make it difficult, but in the name of accuracy ne are trying to get the subject under control.

Staying on a similar subject Lars in Finsteraalde, Germany \& Vassily in Moscor both ask why so many stations speak the numbers in different मays to every day speech.

The first part of the answer is to do pith short pave reception. Hords can easily be mis-heard and so nearly all German language stations seen to use Svo for 2 because Zaei sounds like Drei over the air. The more difficult part of the ansaer concerns the 'odd' pronunciations. This is caused by none native speakers reading the numbers. So you have peculiar corruptions to familiar pords vith Polish announcers reading German and Hungarians reading English ! The results are sometimes less than satisfactory and it is a monder that agents know phether to blon up the bridge or go to the dinner party ?

On now to the subject of books. Tony in York prote to tell me that 'The Hobbyists Guide to Conint Collection \& Analysis' which uas revieared in issue 10 is available in the UK. Details can be obtained by contacting Lore Blectronics, Chesterfield Road, Matlock, Derbyshire. Telephone UK 01629-580800.

Tony also mentions the "Audio Guide to $S W$ Sounds" ; cassette available from Interproducts, 8 Abbot Street, Perth, Scotland. UK $£ 4.95$ inc postage gith over 30 sounds in all.

Simon Mason told ne about a nem book called 'The Ultimate Spy Book' by H. Keith Melton. It contains several pages shoring spy radios and one time pads. UK price is about $£ 16$. He nill try and obtain more details on this, if any reader purchases a copy pe pould appreciate a revien and ISBN details.

Jonathan in Zimbabue is reading a book called "Bvery Spy a Prince" billed as the No. book about Israel's Secret Intelligence Agencies and the "Complete History of Israel's Intelligence Community". Of interest are rather short descriptions of hor commacations are maintained gith field agents in various instances, including coded messages broadcast during an apparently normal Israel Radio transmission, a female agent in Beirut aho sent messages back to $H Q$ by using a fayourite piece of Mossad technology, an anazingly tiny radio set, also an agent in Bgypt who carried around a transmitter in the heel of his shoe!

The book is mritten by Dan Raviv \& Yossi Melman, published by Houghton Kifflin ISBN 0-395 58120-8 (paperback) 473pp.

A fer quick mentions to regular contributora Vagaily in Moacor. And - Ian in Scotland who tells ne his prehistoric typerriter went the way of the pterodactyls and is nor yorking on his nep WP. Greetings to Jia in Strathkiness, Ivan in St.Petersburg \& Ken in Doncaster, and Hans in Trier, Gernany. Thanks to everyone for the logs ners and information.

Hi nor to Tom in the USA. Sorry re could not fit your letter in last tine around. Tom nentions stations 72 \& M8 which he is convinced are related. (Bd. They are) He tells us that he heard the voice station sending a normal message but with $M 8$ in the background of the YL sending $C H 5 F$ cut numbers. When the KL went off air, so did the Morse signal, even though it did not sign of with its usual AR AR AR SK SK SX. This was a problen with the mixing, not tro stations on the same Prequency.
He are very interested in comments concerning a station heard in North Anerica aith the call sign P7X (this station uses a sinilar format as P8K) which pops up from time to time sending 120 group messages fith high-speed data transmissions betreen nessages. The preambles are alvays the sane : VVV DB P7X IIPII 140230 GR 120 BT , then goes into 120 group nessage. The group 140230 is the date and time. This station sends tro nessages an hour, repeating each one, for a total of four transaissions an hour. The station uses one frequency, sending messages none stop for several hours. This vill occur for about three peeks, when the station disappears for a phile. It will then appear later on another frequency, where the whole process starts over again.
I have heard this is some kind of training activity, (interesting) but I can't speculate on who would be using this station. Frequencies noted in North Anerica are $3278,4440,5125,5387, \& 5431$. I have also heard this station using call signs E81 \& K3C. (Bd. It is believed to be French).
Finally, Tom nentions our feature on Nep Star Radio in issue 9. In the "Looking Bast" colunn it mas stated that the "Nep Star" station had poor reception in SB Asia on 8300 kHz . I thought I should inforn you that I ras in the Philippines in 1990 , the 8300 kHz station had a trenendously strong signal. The carrier stayed on 24 hours per day, and was, in fact, a nuisance when trying to listen to signals close to the frequency.
My thanks to Brian in Cranley, your comments are almays appreciated. Brian mentioned our recent piece concerning Radio Northsea International. He says he was unarare of Bollier's involvement in the Lockerbie incident, and several of the other connections you mention. As one of those dedicated listeners, I do remember listening to RNI all the time it mas being jammed, and in particular the time when RNI tried constantly to change its frequency to avoid the janming, only to have the poberful government transmitter saeep over it after about 10 seconds of retarning to the air on a ner frequency.

The one incident that alays stayed saga, nas the total about-turn aade elected as the new government, over their election pledge to legalise stations. The suggestion ras, that once in porer, they had access to secret papers which rere not available to them while in opposition, and that this information was of such importance that they were forced to change their policy.

The subject of RNI and the espionage connection is explored to a limited extent in Paul Harris's book "To be a pirate king", which seems to be the source of the original story. (It is not - M.G.)
Another of our regular contributors is Mike in Kent, I will start pith an apology, in issue 10, I (Chris) made an error in a comment sent in by Mike in Kent. The section concerning the Buzzer ( 4625 kHz ) should have read, "Is it a propagational marker ?" And not " it is a propagational marker". Sorry.
Mike is interested in hearing from other members in Kent \&ast Sussex and nould be pilling to set up a Southeast meeting of members every six months or so to have a "मorkshop". Please mrite to Mike via BNIGMA and pe aill pass on your letters.
Another regular reader arites to say that he mas listening to R. Netherlands a few weeks ago and they were talking about espionage in the Bosnian Har. They said, although it aas hard to hear, that several people had been jailed for espionage who cane from Croatia and had been caught spying in Serbia. Some aere also Serbs aho had aorked for the Croats and spied on Serbia's extensive Military Industrial Complex. One of these 8 people aas apparently a Canadian. People passed secrets from Serbia to Croatia - mostly technical data, particularly concerning their arms industry.
Details were fea as the cases had been behind closed doors but there had been extensive use of computer disks being smuggled across borders with data such as plans hidden in anongst computer games and other innocuous files. Most espionage over there tended to be of a technical nature according to one of the journalists although the details pere sketchy and the broadcast was hard to hear.

Hello now to Peter in Saffron Walden. Thank you for the comprehensive logs and information. Peter keeps us up to date on a good selection of stations including the B5 Counting Station. He mentions some recent errors in transmissions. On the April 8 transmission 6970//8143 he tuned in just after the hour for call " 726 " when the voice vent off air and pas replaced by a tone, pulsed at about 3 per second, which lasted for about a minute, then the voice came back starting the call up fron the beginning. The transmission did not start until 18.18 UTC.

On April 24 the 8116 kHz transmission was found at just after 13.00 but already in the 5 F message - normally this pould be in the preanble. The repeat came at 13.05 UTC, followed by "Count 196 " \& a second reading of 5 F . "End" just before 13.23 , noisy carrier ment off a fep minutes later. 8116 was one of the frequencies on which I heard an audio tone along with several other BS frequencies at approximately 08.00 on Monday 11 March.

After the transaission on 8116 had ended $\&$ the carrier had gone off at 13.23, after a fer minutes the same noise-filled carrier came back on at 13.27, nothing until 14.00 when an audio FSK type data signal began- like fast RTTY. I have heard something like this before during the $\quad$ inter evening on several frequencies in the $4 \& 5 \mathrm{MHz} r e g i o n$.

Bd note. One theory is that the $B 5$ messages are sent to the transmitter sites in a compressed data format, sometime just prior to transmission. These are then decompressed into the messages which ve hear. This could account for the strange "audio background" to B5 messages, and poor audio quality.

Petar also comanta about the recent mention of the Rrogers, - I didn thealise until last year that a feature film had been made of their activities. It mas called "Ring of Spies" and mas made in 1863 in black \& ahite. (Bd. A book of the same title pas also published) I aas unamare of its existence until I happened to see it quite by chance one afternoon on Channel 4 about 18 month ago.
Kai in Blsterperda nrote a detailed letter and conments on the "Tyrolean Music Station" G1. First : Renember, that these mere operated by the "Ministeriun fur Staatssicherheit" (MfS) of the Gernan Democratic Republic. Number transmissions of the MfS have transeitted from Kōnigs Wusterhausen, south 100 kH short-qave) this site had broadcast transmitter (including $4 x$ one of the services these some 20 kw utility pas the "AgentenfUhrstationen" (agent command transmitters carried MSS. Utility services from Rönigs Husterhausen completely shut-down on October 10 1990. All transmitters aere dismantled. The former utility transmitter hall is nop a little museun. It is rumoured, that MPS number transmissions also came from site around Kagdeburg. The background for these suspicions is, that in $935^{\circ}$ programe mas audible. It is mell knomn that strong AM transmitters can couple into nearby audio equipaent. Soldatensender $935^{\prime \prime}$ came from a 250 kW transmitter at the station in Burg, near Kagdeburg. According to station staff in Burg, the for 261 kot ever a short aave transmitter, only broadcast transaitters for 261 kHz Long Have and Mediur Have.
In the past Burg had tro 250 kH mediun aave transmitters, one carrying "Deutschlandsender" on 782 kHz , the second pas officially declared as the back up, but in fact carried "Freiheitsender 904" and "Soldatensender $935^{\circ}$. From 1978 Burg had an additional operat transmitter on 783 kHz , and both 250 kW transmitters are nop operated on 657 \& 1575 kHz respectively.
Burg also carried Radio Volga on 261 kHz . This transmitter is still in use.
Kai says, I think, there is no reason to doubt, that Burg never had short wave transmitters. I think, that it is only a rumour.
$\qquad$

B10) Station message strings. I have received several letters, aith thanks to Michael in Nercastle-under-Lyne and Brian in Cramley concerning my request for information about message strings from the B10 stations. e.\&. VLB D14 D15 D16 D18. I an preparing a feature on these for issue 12 so if any readers would like to contribute copy logs (it doesn ${ }^{\circ}$ matter if they are old) or suggestions on what these may be or any other aspect of their operation please send then in.
I'have some interesting theories to float about these special transeissions.

Hi nom to Andres in Landaberg Germany. Andres sent in another very detailed collection of comments and logs. Included this time around was his recent visit to Prague. Close to Prague castle is the Ministry of Foreign Affairs (MFA). After visiting an exhibition Andreas had a closer look at the MFA and spotted a strange construction of wises ahich pere surely an antenna, he tells us that he could not see the whole construction which pas well hidden.
"There pas an exit of the MFA, which pas open to let someone out, at this point I could see three Log-Periodic antennas and a strange one that I could not easily describe. I also sam a little T-antenna which is possibly for receiving signals. So $I$ ask : phat are these antennas used for ? I don't think that such constructions are there to monitor signals from all over the porld. I'm also not aware of short wave traffic of Czech embassies back home (does anyone know about this ?)-and the antennas did not look new."
He also know about the many Czech Number Stations. OLX is operated by the Ministry of Interior, tho tell us no other service operates on behalf of the MFA, or maybe the MFA operates it on behalf of the Ministry of Interior."

Bd note; Why does a small country like the Czech Republic operate a Number Station 23 hours per day? I ponder, perhaps they send traffic to Central Europe and the CIS for another mel known agency which ends in a 6 ! Certainly something still cones out of the Czech Republic for its on intelligence agents but it is not likely to be via OLX.

I also managed to read through "Der BND" by Erich Schnitt-Benboom, the best researched book on the subject of intelligence I have ever read. It pas recommended in an ENIGMA some time ago. The book does talk about the Hungarian Intelligence Service. Prior to 1989 it pas known as AVH (Allanvèdelni Hatosag) and because of its successes against NATO-states it mas feared by the Hest. It pas then turned into the Organisation for the Protection of the Constitution. The nev government (in 1981) gave up espionage in foreign countries completely. (Why did they continue to operate Number Stations then ?).
There pas also a small scandal because of the TRIED investigation of opposition politicians. The Hungarian government even apologised to Western countries for what they did in the years prior to 1988 . I think they did not give up espionage in foreign countries completely, 3 Note Oddity \& VDE are both active. They may have just changed their targets onto former allies like Romania, Slovakia \& the former Yugoslavia. That could easily be regarded as only a domestic operation, because all these countries have borders pith Hungary and in addition Hungary can claim to have a security interest in the countries.

Another thing that pas reported on Radio Budapest, German service, pas that after 1989 several hundred people are said to have been observed without permission by the Hungarian Intelligence Service.

The leader of the German minority in Hungary protested that his organisation pas being observed. He requested to know the background, reasons, and details about just mho mas observed. The Minority Bureau also received complains from both Serbian and Greek minorities.
${ }^{3}$ The observationa pere asid to have atartad on the Southern border in 1892. Refugees from the former Yugoslavia came into Hungary and the Secret Service panted to restrict "irritations" in the local comunities among other minorities because of the incoming refugees.

Also the German minority in Poland is reported to be under observation by the Polish Secret Service, the UOP, one Minister of Interior described them as "a potential danger". (Mitteldeutsche Zeitung, 5.86)

Andreas tells us that he is reading a book called "In Dienste des Gegners" (freely translated as "Serving for the Bnemy") by Heinz Felfe. He tells about the CIA in GDR/FRG. "The net for monitoring/transmitting radio signals from the area of the FRG nas very wide ranging. In 1858 a part of this programe rent under the name "operation Seatrail" and aas conducted by the 513th Military Intelligence Group with the HQ at Camp King in Oberursel. There agent radio operators from socialist countries, esp. from the GDR rere trained. The selection of persons as agent radio operators from socialist countries pas conducted in such a qay as to ensure that the person would be living at hone at a time of par. The German speaking operators aere equipped with radio and code material aith the intention of transmitting information at times of political unrest or मar... same the other pay round. The radio operators of the BND pere controlled by Anerican Intelligence.
Mike's report on the Anerican numbers scene pas very interesting. There you see, hom important BNIGMA is - a forum for discussion and the exchange of ners.
The FCC is not reliable in terms of Number Stations for then everything cane from Nicaragua, the US Soviet Embassy - or they traced a thing to "domntown Havana", sometimes even telling the Soviet embassy there.
And last but not least pe rould like to pass on thanks to Christian in Orianenburg in the former DDR. Christian is a blind DX'er pith a keen interest in Number Stations. He have received from hin via Andreas over 3 hours of cassette recordings of transmissions from the $1970^{\circ} s$ and $1980^{\circ} s$.
The receipt of these tapes have provided BNIGMA rith considerable anounts of nea information about both past and present operators and allowed us to fill in the gaps of station evolution.
As a direct result of these recording ae have been able to considerably update our "Control List". Nen recordings received not only include stations never previously heard but also variations to existing stations.

A Polish language version of the "Strich Family"
A Hungarian language version of NNN
A German language version of Edna Sednitzer (S4)
An English (accent) version of the Counting Station
He hope to provide much more detailed information in issue 12 , following further analysis of these recordings.

We recently received a copy of the latest catalogue from Interproducts the specialist radio book publisher and distributor.
Whatever your field of interest, shortwave, VHF, or UHF - you are likely to find something to add to your bookshelf.
New books include the 5th edition of the UK Scanning Directory and something curiously called the 'Police Scanning Club'! Books on both aeronautical and maritine communications are also plentiful.
ENIGMA readers fill be interested in the updated 'Intercepting Numbers Stations by Langley Pierce claining to have all the latest active frequencies. However, Simon Mason informs me he ordered the so called updated version and received the first edition. On returning this to Interproducts he simply received a refund with no explanation. Does an updated version exist? Any comments Langley!
'Gavesdropping On The British Military' by Michael Cannon gives details of how to tune with ease into the secret world of British Military Communications and includes frequency lists from VLF through $H F, V H F, U H F$ upto satellite.
'The Clandestine Broadcasting Directory' by Mathias Kropf is another interesting title by one of Europe's top authorities on the subject.
New is the 'Shortmave Eavesdropper CD-ROM' described by Interproducts as a huge step forward in the accessibility of shortwave utility information. It gives instant access to well over 32,000 frequencies and 42,000 callsigns listing military, tactical, ships - naval and merchant, embassies, aeronautical, press agencies, weather stations and countless more. In-depth country by country information containing QSL addresses, schedules, examples of traffic, and maps are also included.
That's not all ! The DX Edge shows you in real time where to monitor throughout the day. There are extensive help menus, tutorials and a very large list of $A R Q$ SELCAL codes. There are even audio samples of data mode and number stations. Shortwave Eavesdropper runs on an IBM $P C$ or compatible computer with CD-ROM drive, at least $4 M B$ of RAM running Microsoft Windows 3.0 or higher and sound board which is optional.
Priced at 225.00 including $U K$ postage and airmail worldwide.
This is just a snap shot of the many books and radio products in the Interproducts catalogue which may be of interest to ENIGMA readers.

You can contact Interproducts at ;

## Simon Mason Writes

Hello again and welcome to another column. This time $I$ was going to go into some detail regarding the Hotel Kilo and Sierra Bravo transmissions but of course Murphy's Law came into play and both these stations vanished from the air in February 1996. At the time of writing only three of the 2 Letter Stations ( $E 16, G 16$ ) are operating. These are Mike Delta (E16) Golf Kilo and Whisky Lima (G16) which are currently on air at the following times -

GOLF RILO
MON 19.00 TUE 20.30 WED 20.00 THU 22.30 FRI 19.00 SAT 17.30 SUN 20.30
Try frequencies for GK - 4594488893251017712314
MIRE DELTA
TUE 13.30
THU 13.30
SUN 09.00
Try frequencies for MD - 1154512092122101389016220
HHISKY LIMA
TUE 19.00
THU 19.30
SAT 17.30 SUN 10.00
The transmissions of MD WL \& GK are something of a reduction compared to only a few years ago when over 80 different call signs were on the air! AU is still around but only very occasionally.

A visit to the library turned up something very interesting. In a book called "Inside the KGB" by Aleksei Myagkov I noticed the following item under the heading "Some revealing traits in the actions of an agent receiving one way transmissions or engaged in radio communications.
The book listed 9 tell-tale signs which may indicate espionage activities.

1) Reeping awake two nights running at times of crisis etc.
2) Ascertaining the fact of postal correspondence being dispatched after the day fixed for radio transmissions.
3). Discovery of his definite frequencies and notebook with 5 figure groups.
3) Presence in the attic, in his room or in a shed of large aerials erected for transmission, or of insulated pieces of wire which could be used as an, aerial.

## 5) Use of headphones.

6) Creating the impression that the suspected person is absent from the flat at the time of reception.
7) Refusal to receive visitors especially on the day of reception.
8) Recording radio broadcasts on a tape recorder.
9) Concealment of knowledge in radio matters.

How many ENIGMA readers would fulfil one or more of these criteria?

A strange request was published in the World DX Club's Contact magazine recently by Mr Podney R. Sixe of Redruth in Cornwall. He says "Can anyone help me in obtaining an Israel Radio programme schedule of some years ago which shows the frequencies 27905 \& 27790 in operation. Also, I am keen to get a cassette recording or log of the 3rd harmonic of the "7m" pop music grind jammer on either 29085 and/or 29115 kHz .

I hadn't heard of either of these transmissions before this, has anyone else?

In the final death throes of the 2-Letter Stations, on July 3rd 1996 at 21.00, Golf Kilo sent the following group headings. " 85631 gruppen und 43 gruppen. 57171 gruppen." Altogether 145 groups which ended at 21.24.

Next a couple of logging's which are quite interesting : New Star Broadcasting (V13) Station heard at 22.00 sign on with identification, music and messages on new $9725 \mathrm{kHz} / /$ to 8300 kHz . (CONTACT MAGAZINE)

4768 kHz "Cherry Ripe" spy numbers station heard here at 20.00. Same $Y L / E E$ as "Lincolnshire Poacher" but different tune. Heavy jamming on frequency possibly from Red China, as this station appears to be in Singapore. (U.S. MAGAZINE - POPULAR COMMUNICATIONS)

Those of you who try your luck on the National Lottery might use the random properties of the number stations to choose your weekly selection.

I prefer to use Mike Delta YL/EE station but any will do, except perhaps OLX which is a little too fast. I take the first two digits of the $5 F$ group if they are between 1-49, any above can be ignored. For example, 12113890034233323322 3339909037 would produce the numbers 12, 03, 42, 23, 33, and 09. This method has yielded two $£ 10$ wins in 4 months.

If you win don't forget my share!

That's all this time around, Good Listening.

Short shrift
ANYONE who doubts that spying is still rife after the supposed end of the Cold War should tune in a short wave radlo any evening between 3 and 20 mHz . They will come across a robotic female voice reading groups of five numbers in English, Russlan, German, Czech, Spanish, Chinese and other languages.
Now and again they may hear
a male voice in Romanian. Eng. lish and Russian. These transmissions are instructions in code sent to spies in forelgn countries. they have not decreased in the past ten years. If you come across the someone slinging The Lincolnshire Poacher, followed by a Britishsounding woman, are you listening to MI6? Nobody knows

SMMON MASON, Hull
-
DAILY MAIL 22.5.96

## NORTH WALES SEY SEN DUG IIP IN 1980

Following our request for information in issue 10 the following article was received by ENIGMA．
＂In response to your request $I$ did some someone who knows about transmitters．He and collects old military radios so was direction for information and gave was information in the articles was sketchy and well informed opinion．The dis－information which was considerable in this case．
In 1980 a field was being ploughed in North Hales near Llangollen． 26 year old Goronwy Morris was working on his father＇s 600 acre farn when a carrying case which looked like a portable typerriter was unearthed in the soil．It seens that it was also wrapped in a plastic wrapper．

It was shown at a National Farming Union meeting to branch secretary， Meurig Voyle and everyone present also agreed that it was a spy radio set but nobody kne⿻口㇒日小 what to do with it．The press were told and then the Police．The Police gave the farmer a receipt for a brown box 14.5 inches by 10.5 inches which contained radio equipment．This was the last time it was seen in Hales．Police and Home Office people descended on the farm at Pant y Maen，Llanrhaedr ym Mochnant．They used what they said were metal－detectors all over the area where the set was found and the farmer signed a disclaimer saying he had no right to it．They would not let him watch the search．The Police gave it to the Home Office who then said they didn＇t have it and that was the last anyone saw of it．Everyone denied knowledge of it including the Anti－Terrorist Branch and Special Branch．A photo had been taken of the set by Voyle before it went to the Police Station at Colwyn Bay．I had heard that messages were put on perforated tape and put through a reader for fast transmissions according to one reporter but I do not know if this was the case．Dis－information is rife！

The local MP wrote to the Home Secretary who said that the set was of foreign origin and was examined by the Security Service．There were no clues to its origin except some bolts rith USA stamped on them．It had a wire recorder for sending coded signals at ultra－high speed． There were 40 metal cased frequency crystals in the box which was like a typerriter．This was all in． 1980.
In February 1981 a 2.5 inch strip of microfilm was found by the farmer on his desk and he guessed it was fron the radio．It had 5 pages and was called＂Transmitter Handling and Maintenance＂and referred to the device as being housed in a＂dead box＂．An expert examined the instructions and concluded that the radio was from 1965 and could reach Bastern Europe．He felt that a sleeper had buried it who could be activated in the future．A language expert said it was translated badly from a foreign language，probably German．Many Germans go on holiday in that area and one of then could have buried it．It was also found that a party of Russians had stayed nearby years before and they only went out at night．

It later energed that this Russian "trade delegation" contained four people who had been expelled from Britain in 1971 in a mass expulsion of 105 Russians folloring the defection of Oleg Lyalin. This Department $V$ KGB officer revealed much information on Russian sabotage pians. He said that saboteurs had been recruited in the UK to destroy radar stations and attack $V$-boaber bases.
Each unit had a radio set for receiving orders from Hoscow and to report the danage they had done. The set was buried in a remote location and one nessage was sent each year to check that the set worked. The one in Hales was well maintained and it was felt that it had been serviced. It was thought that it could be for a unit who would comnit sabotage in the Port of Liverpool or attack the Anerican base at Burtonwood.
Transmitters are occasionally stored in the hone under a floor or in a wall or possibly in a garden but then there is a danger of damage from the weather. If it was Russian though I feel that it would have had an anti-handling device because the one they trained Sabotka in Canada to use was a large grey box with a telephone dial for entering coded messages which was squirted when a button was pushed. The instructor told him that it would explode if it was opened or tampered with and if it broke down he should not attempt to fix it! It was such a sensitive device that he would receive it via drop in Canada after he arrived there. The Krogers had 3 transmitters, $I$ believe. One was buried in the garden, one was under the house and one was under the coal-hole. None of these had an anti-handling device. A defector revealed that buried transmitters in renote locations have a detailed description and photograph on file at the centre in case they are ever needed.
Much of the info concerning the Helsh radio is, $I$ an assured, disinformation. The vacuum tubes were from Mullard and Sylvania, a UK and US Company and the instructions were in English. It was probably an early version of the GRA-71 burst transmitter which was lost on an SAS exercise and then dug up by accident years later. The smoke-screen of dis-information was merely to hide their annoyance at it being dug up again as the area is frequently used for exercises. The wire recorder I suspect was some form of key pad to input messages as magnetic tape recorders were in use by the 1960 's when the set was believed to have been made. Hints of East European involvement or SPETSNAZ being behind it are dis-information. Some trooper probably buried it and then forgot where it was and then it was written off.
He probably ended up cleaning the toilets with a toothbrush or painting grass green or many other exciting, interesting and useful things they use humble squaddies for. It could have been for use in case the UK was invaded or in the aftermath of a nuclear uar to retain links with units still behind enemy lines. It may also have been something to do with the "Gladio" system. The real answer, as always, will probably never be known except that it is probably a fine example of British technology in the 1960 's and caused embarrassment to somebody, somewhere.......It is an ENIGMA......."
Our thanks to ' $D$ ' and Simon Mason for information used in this feature, derived frum 'Popular Communication's' June 1989

RUSSIA STEPS UP SPYING AGAINST GERMANY writes Robin Gedye in BONN.
Russian and eastern European espionage against Gernany threatens internal security and is an "outrageous political affront" to the aid and cooperation offered by Bonn, a recent Interior Ministry report stated.
While military espionage remains a priority of the Eastern intelligence service, attention has been diverted to spying out new technology, where Russia is trying to save time and money by stealing Hestern expertise.
Germany has become the focus of attention for Russia and the former Soviet bloc states because of its strategically vital and accessible situation at the heart of Europe, the report said.
"Russia's pledge to stop'sending agents to Gernany after the Cold Har has proved thoroughly empty," said a counter-espionage expert.
"Thousands of agents are falling over one another here from the Russian Federation, to Poland, China and the Middle East. Not only has there been a steady increase in espionage over the past five years, but a burst of activity since last October shows President Yeltsin has ordered an intensification." The report describes the restructuring of Russia's intelligence service since the collapse of communism, saying they have increased their effectiveness.

The FSB counter-espionage department, with 100,000 agents, has taken over the intrusive and onniscient role formerly filled by the KGB. Its ner prestige marks a return to the pre-Yeltsin era of a largely homogeneous intelligence service, the report claims.
The FBS's porer's have been extended to fighting organised crime and terrorism. In addition to controlling security in the police and lilitary, it looks after economic and foreign security. The SBP, classified as the most sinister intelligence branch, coordinates intelligence services and reports directly to the Russian president on security and espionage.
The SBP is above any legal or constitutional control operating in a highly conspiratorial sphere" according to the report. The GUO, a sub-unit of the SBP, is responsible for the security of the president and Government ministers. The GRU, the military intelligence organisation, has remained untouched by changes to other services.

US Challenge in gulf radio har arites Robin Hright in hashington
The United States launched a new offensive in its campaign to undermine the regimes in Iran and Iraq recently fith inauguration of a radio transmitter in Kurait 12 times more powerful than any allowed to operate in the United States.
Bconomic sanctions, political isolation and a strong US military presence in the region have made no significant differences to the policies of the governments in either Iran or Iraq. Now the US is trying to appeal directly to local population's.
"Information is a powerful weapon," said Geoffrey Cowan, director of the Voice of America. "So if getting information to people in Iran about democracy and human rights and about what's happening in side their country and in the world makes a difference politically, ?hen this will be a transmitter of tremendous importance".

The 600-kilowatt transmitter will beam signals as far as Central Asia, the Indian subcontinent, the Gulf and the eastern Mediterranean, making US broadcasting available on home and car radios.

The biggest impact will be in Iran and Iraq, where audiences are expected to expand significantly because listeners will no longer need short-wave radios to pick up American broadcasts. The transmissions will be impossible to jan. (Ed. I an sure they will try).

Iranian broadcasts dominate the airwaves in the region, and Washingtun has been unable to counter them, largely because of poor access to local transmitter sites. The Kuwait move marks a major break-through because governments in the Gulf have long rejected US requests to build a mediun wave relay station.
Could any readers confirm if this station is now on air and also the frequency in use. Is it jammed? Information appreciated from you MH buffs.

Just a bit of space to say thank you to everyone who sent in a letter logs and information. He read everything. Information is also retained for use on future features and projects.

Sorry we are not always able to provide a personal reply. The next issue of ENIGMA will be published around the end of EFBRUARY 1997. We would appreciate your contributions by FRIDAY 24 JANUARY 1997.

This mill give you plenty of time to digest the contents of this issue and listen out during the cold winter nights !

In the next issue of ENIGMA ;
Full updated control lists for both Voice \& Morse.
Feature on the 510 - Phonetic Alphabet Station - Message Strings.
Plus all our usual sections.
He will also be looking to complete those features which we started in previous issues, including the Czech stations.

PLEASE SEND IN YOUR RECEPTION REPORTS COMMENT AND LETTERS TO ARRIVE BY FRIDAY JANUARY 241997.

HE NEED YOUR CONTRIBUTIONS AND VALUE YOUR SUPPORT OF ENIGMA THANK YOU

## haYANA MOON

10 and the late news iten concerning Havana Hoon. My thanks to Ken in Doncaster for the folloaing article which appeared in the March issue of the US magazine Monitoring Times.

Who was Havana Moon, Sone readers may not even remenber Havana Moon or the era in mhich numbers transmissions were much more a mystery than they are today.
Havana Moon has a pseudonym used by Willian T. Godbey, a former US Intelligence office who becane known in the hobby as one of the foremost US experts on covert radio and short wave numbers transmissions. Bill urote a regular column for Monitoring Times fron May 1983 to June 1986. He died on January 9, 1996, at the age of 59, after a brief illness.
Bill recently retired from numbers chasing and spent the last several years happily and quietly with his longtime sweetheart and companion, Christine Klauberg Paustian, and her family in Westchester County, New York. The following is a short sketch of Bill Godbey, the man behind Havana Moon, as remembered by Christine. She pould velcome letters fron fans and friends c/o NetSurf Technologies, 1858 Pleasantville Road , Briarcliff Manor, NY10510. U.S.A.
When Bill first told ne about Havana Moon I laughed. And so did he. He alnays relished a good joke - I can still hear that distinctive chuckle, and see the impish grin and the trinkle in his eyes.

The persona that became a legend was born out of a joke over twenty years ago, and this tine, he cane to be known as what may have been the foremost US expert of his time on the odd short wave aystery broadcasts known as the Number Stations.
He was a radio buff for most of his life. Bill got his first ham call, H5YHS, back in Arkansas when he was just a kid of 12. He developed a fascination with codes and ciphers, and his expertise in cryptography took hin into various military intelligence comands, which led in turn to a career as an intelligence officer in the National Security Agency. That affiliation was the reason for all the mystery, and the pseudonym. Anonymity seemed the best way to handle the whole thing who ever knew that it would take on a life of its own!
Bill earned a degree in broadcasting and journalisn from Arkansas State College. He spent years as an air personality and Progran Director at AM stations throughout the south, before moving into the yorld of newspapers. He worked at the Oaklandrribune and the Pala Beach Post for many years. He was a talented and accomplished photographer, an avid gardener, and he knew nore about rhythn \& blues and rock \& roll music than anyone $I$ have ever known.
The Numbers colums and articles first appeared in the Newark News Radio Club bulletin, and moved through the years to Monitoring Tines, Popular Communications, The $A * C * E$, Umbra et Lux, The Numbers Fact sheet, Los Nuneros Online, Clandestine Confidential, Radioscan and SIGNALS.

There mere a couple of books, and countless radio and magasine intervieas - all about numbers - an oddly arcane subject made all the more fascinating by the silent silhouette in the black fedora.
In the last years of his life, he pursued more traditional and ordinary things - he loved our house and garden, and competed in a good-natured way mith the neighbors to make our home the showpiece of the block. He got a new han license, $K B 200$, and hung out on 2 neters and in the diner with a bunch of his cronies. He loved his radios and tag sales, the lottery and pepperoni pizza - crossword puzzles, the Sunday Times, and a good cup of coffee - he loved the blues, the Honeymooners, and our menagerie of assorted children and pets.

I treasure the years we had together. And as much as $I$ would like to have kept hin all to myself, a part of me is glad - finally - to share the real man with all of you. Hillian Thomas Godbey was born in McCory, Arkansas, on September 5, 1936 - he died peacefully in North Tarrytoan, New York, on January 9, 1996.

Christine Paustian.

## THE LAUGHING CAVALIER

Back to Britain now, but staying on a similar theme. Fron American numbers monitors onto a famous British name from the past. The 'Laughing Cavalier' nas a regular contributor to Short Wave Magazine for many years and sent in numbers logs and information. This was at a time when no one really dared to mention the subject, let alone openly write about it in a British magazine.
You may recall that ae appealed for information back in issue 8 about the Laughing Cavalier, the folloaing arrived concerning hin.
" You asked about the 'Laughing Cavalier'. This person was actually called Peter Quientel who was an ex- GCHQ analyst and one time SIS officer who took early retirement. He was in a clandestine radio society in London which specialised in listening to numbers stations. His knowledge $日$ as considerable as he worked in COUNTERCLAN in the 1960s. I regret to inform you that this person is now dead and a sad loss to the underground radio monitoring world. He used to keep his logs and notes well hidden resulting in their loss after his death and so they are not available to anybody. Most of his knowledge died with him although he rarely talked about the details of his rorking life.
He is survived by a $u$ ife who still lives in London although she knep very little about his working life".
In another letter concerning Peter Quintel ne heard that he had indeed died from a heart attack at his hone in London and had monitored number stations since 1961.
If any readers have any further information it nould be nost appreciated, also if you have any copies of his information which appeared in Short Have Magazine re would appreciate a copy, from memory it used to appear in the SSB Utility Listening colunn when it nas edited by Peter Rouse, although material may also have appeared elsewhere in the magazine.
Can anyone tell us more about COUNTERCLAN and also the Clandestine Radio Society in London which are mentioned above?

## Things That Go Buzz In The Night

HAARP - The Truth is out there (but finding it could prove almost impossible).
In our last issue we asked if any readers could provide information concerning hatrp - High Frequency Active Auroral Research Project.
We received considerable material via the Internet and also a copy of the book "Angels Don't Play this HAARP - advances in Tesla technology" (more on this later). The problem comes in finding the middle ground betreen the extreme views held in some quarters and the official line - somenhere along the path is the truth about HAARP.

If you have not heard anything about hAARP the following feature aritten by John Fulford provides an excellent introduction.

## What's Happening in Alaska ?

Should you find yourself in Alaska this year, take a side trip to a location approximately two hundred miles southeast of Fairbanks. You will be in the tom of Gakona, Alaska. Proceed donn the Tok Highaay to mile marker 11.3. This nill place you at the geographic coordinates of 62 degrees 23.5 minutes North and 145 degrees 8.8 minutes Hest. Find the big gate that says HAARP RESEARCH PROJECT. You are there.
Where is "there" and hhat have you found ? Proposed in the early 1990's and due for completion somerhere around 2002, this is the site of the joint U.S. Air Force and Navy project code named HAARP-High Frequency Active Auroral Research Project.
Much speculation has been aritten regarding this project-all the aay fron a doonsday machine which will destroy the earth, to a machine designed by the government to disrupt brain patterns, change the weather, interfere in wildife migration, and even burn a hole in the upper atmosphere.
Putting the intent of the project aside for a moment, what we basically have up there is a massive transmitter array. It is a phased array, built on a 33 acre bed of gravel, neasuring approximately 1000 by 1200 feet. There will be 180 towers arranged in a rectangle, each of which aill support at its top tro crossed dipoles. One set of dipoles aill be for the lon frequency array, from 2.8 to 8 MHz . The other is for the higher frequencies from 7 MHz to 10 MHz .
Providing perimeter protection around the array is an electrified fence which will keep away the roaming animals. There is an elevated electrical ground approximately fifteen feet above the ground under which vehicles may drive between transmitter shelters and the control room.
There will be thirty individual transmitter buildings constructed. Inside each building qill be six 10 kW transmitters. The radiated porer will be $6 \mathbb{Z} 30 \times 2 \times 10 \mathrm{kN}=3,600 \mathrm{~kW}$. The entire project aill be powered by six $2,500 \mathrm{~kW}$ generators.

When the transaitter are energised, they will provide a radio signal that is very narron bean and is adjustable in amplitude and phase. The field intensity will be a few hundred aillivolts per square netre This is less than the natural ultraviolet radiation present in those latitudes.
The actual project rill be in tro parts, the first part described above, to be knorn as the High Frequency Ionospheric Research Instrument (IRI). The second UHF radar known as an Incoherent Scatter Radar (ISC). It will be used to measure electron density, electron and ion temperatures, and doppler frequency drift. The tro U.S. Governnent agencies involved are the U.S. Air Force (Phillips Labs) and the U.S. Navy (Office of Naval Research and Naval Research Laboratory). The government agencies have publicly announced that this research station will be used in instrument design, including $H F$ ionosondes, $E L F$ and VLF receivers, magnetometers, and a project know as LIDAR (Light Detection and Ranging) in both optical and infrared spectrum.

What does this mean for us radio spectrun listeners? What will this machine do to the radio spectrun ? Frankly, we don't knor. It is a research instrument that will heat the ionosphere and allow the earth bound scientists to measure nhat these heated ionospheric particles aill do to radio transmission signals.
Modulation of one radio transmission by another radio transmitter will be exanined. This ras first noticed in 1933 rith Radio Luxemburg, which aas superimposed over another European long wave station. Both of these long aave stations were located in the upper latitudes and both had output powers over one nillion aatts. Talk about upper atmospheric heating!
Those who live at the latitudes involved with this transmission system, have speculated a great deal about about the effect of these transmissions on the Northern Lights. The Northern Lights, or Aurora Borealis, areak havoc with morldride radio transaissions, especially in the short qave spectrum. What will happen if this project has an unexpected effect on these lights? Could such a project have a pronounced impact on short wave radio as we knoa it ?

Tпо other ionospheric research projects are operated by the U.S. Government : one in northern Alaska and the other at the observatory at Arecibo, Puerto Rico. Both of these have been in operation for years, although their radiated porer is less than that proposed by the HAARP project. He have all heard these ionospheric saeepers throughout the shortrave band.
There is a five-nation consortium based in Burope which is doing the same thing. Known as the European Incoherent Scatter Radar, * this has one site in Normay, one in Peru, another near Moscor, and two other sites. This project also involves ionospheric heating at powers less than what is proposed by the HAARP project.
The project is due for completion in 2002. If you are connected to the Internet, do a Hebsite search for the keyword "HAARP". There is plenty to find there and some interesting documents to read.

John Fulford
Federal File

Earlier $\quad$ mentioned the book "Angels Don't Play Thia HAARP" Advances in Tesla Technology. This ner book co-rritten by Jeane Kanning and Dr. Nick Begich covers 233 pages on the subject and we can recommend this most detailed and rell researched publication.

Library of Congress Cat Number : 95-61771 ISBN
: 0-9648812-0-9
Published by ; Earthpulse Press P.O. Box 201393 Ankorage Alaska USA

Distributed by ; CRB Reasearch P.O. Box 56 Comack Ne戶 York USA 11725 e $\$ 14.95$ U.S.

So what are we listening out for ? This seems to be a fiair question. But so far no positive frequency or mode information on either HAARP or the European Incoherent Scatter Radar mould sean to be available. It is possible that some of the signals may have been mentioned in our BUZZ pases but not linked with these projects, after all they are rather like the number stations and don't rant to give the game anay.

He rould appreciate any information on possible frequencies or modes for either of the above mentioned projects.

* The full list of sites for the Buropean Incoherent Scatter Radar (EISCAT) are located in northern Noraay near Troasd, also at Jicamarca, Peru ; near Moscor, Nizhny Novgorod ("SURA") and Apatity Russia ; near Kharkov, Ukraine and in Dushanbe, Tadzhikistan.

Welcone along to another "Buzz" page or tro, in our questionnaire you asked for nore fron this section. Ne hope that this issue will provide you with some interesting information. Not only have ae featured HAARP but also a ajor feature on the Buzzer and further information on those mysterious Faders.

But let's just have a quick look at a fer old friends -
THE PIP - No change, still active on 3757 \& occasionally 5450 kHz , best reception in Europe during hours of darkness.

THE ECHO - Moved fron 4105 to nen 3964, but may change again aithout warning, again best reception during hours of darkness.

BACXNARD MUSIC STATION - Nore chaotic information about this signal. Tends to operate in the evenings on $6695 / / 3740$ or 6584//6695. And Day tine 9223.
The signal changes betaeen a low buzzing sound up to a pulsed aarble and is incomprehensible in nature. One report we have received suggests that this is nothing more than feedback from a radio telephone link operated from Algeria! Coments welcome.

THE CRACKLE - No major changes, still heard on 5500/5505, and 9223. Seens to have some connection with the above mentioned Bacmard Music Station.

THB SNEEPING CARRIER - A new transmiagion has recently be日n moted, this operates on a 4 minute cycle at 30 second intervals. The signal sounds just like a jamer and uses a swept carrier. It does horever display an unusual use of frequencies, which are always used in the same order.
Although it sounds like a slow sweeping janner to the passing listener its operation does not suggest any kind of jumming activity.

Frequency cycle and time in minutes and seconds.

$$
\begin{aligned}
& 0.00=7680 \quad 0.30=7690 \quad 1.00=7700 \quad 1.30=9185 \quad 2.009310 \\
& 2.30=93323.00=10120 \quad 3.30=134304.00 \text { Back to } 7680 .
\end{aligned}
$$

If you tune to just one frequency and wait the station will appear aithin 3.5 minutes. Fron this you will then be-able to follow it around its cycle. Any comments on this most appreciated.

FADERS (XF) - We have made some progress with these rather anonymous signals. Detailed analysis shows that the signals are aade up of a multiple modulated $A M$ signal.
The steps are $500 \mathrm{HZ} 1100 \mathrm{HZ} 1400 \mathrm{HZ} 2 \mathrm{kHz} 2.6 \mathrm{kHz} 2.9 \mathrm{kHz} \& 3.4 \mathrm{kHz}$. One reports suggests that these signals are NATO active HODEM's which operate in netmork passing messages. I floated this information with regular contributor Mike in Kent. He comnents ( $I$ will try and get this right this time)" At least ae're making some progress by confirming nulti-node AM. I'n a bit sceptical about NATO modems as most traffic is now on the Milsat's so why should they use HF with all its associate difficulties. The amount of traffic and number of frequencies is also far in excess of any operational requirements on a day to day basis, emergencies excepted. Also no one has heard any voice traffic, $\begin{aligned} & \text { hich could be expected from time to time as various }\end{aligned}$ circuits and nets are set up and equipnent aligned and tested."

Fader frequencies noted since last issue of ENIGHA include (many more are probably active) -
3218 Heard transmitting on top of a "Shipping Warning' of debris from station LYL on April 8 at 20.40 UTC.

Do any readers know about a systen call 'Park Hill' (yes I know it sounds like a brand of cigarettes) - what does the mode sound like? Is it still an active systen ? Help required.
THAT'S ALL FOR THIS ISSUE - THBORIES COMMENTS \& LOGS ALL APPRECIATED.

THE BUZZER 4625 kHz (and occasionally other frequencies)
He are still determined to learn more about this seemingly pointless transmission and I hope the following article will prove thought provoking.
I ask you to forgive me for going over some old ground but hope that the direction we are heading nill be of interest.
A key point to the operation of this station is its starting date and any information me can obtain on this would be very useful. It is my feeling that it began transmitting sometime after 1986 , but before 1989.

Because the signal does not have a call-sign and is not a recognised transmission or I.T.U. registered, then almost everything else is left to the inagination. For years, listeners in Europe and the United States have been fascinated by this signal. Rumours that it came from the former Soviet Union have persisted ( I should add that most things ae don't understand seen to be reported as East European or C.I.S. in origin).
The earliest direction finding results I received pointed towards the C.I.S., indeed the signal has reported to be coning from an area just outside the Polish border in Byelorussia. (It may be possible that the location pas changed). In 1995 I received a further DF fix taken with the use of an HF direction finding station, this placed the signal in an area South East of Moscon. The exact location is reported to be near the tom of Penza some 300 miles S.E. of Moscon.

Before me move onto the questions of who receives the transmitted signals and why, ne pill first look at the mode of operation.
Kuch study, both basic and technical has taken place, but all roads seen to lead to the same point. No complex data or sophisticated unknown mode is in operation. All the Buzzer sends is a simple noise - nothing more than a status indicator. The variant at just before the top of each hour seens to be nothing more than the introduction of a further tone sequence.
So far so good ; we know where the transmitters are and ye know that nothing complex is happening - so who is listening ? Hell, apart from the nembers of ENIGMA and no doubt many other puzzled SH listeners not many others I guess.
Like nost transmitters which send information there is also a receiving station. In the Buzzer's case the signal is reported to be received in Austria. This does sound reasonable, the transmitter and receivers are at fixed locations. Vienna and Penza are not too far apart, the signal remains on 4625 kHz 24 hours per day and although it is not audible in the UK during the daytime I guess it is audible in Austria.
You may ask ahy the Buzzer also turns up on other frequencies for short periods of tine. These are nost probably tests from a back-up transmitter located elseahere, ahich, rould saitch on in case of a problea.

So jugt who ia liatening ? The receive aite ig reported to be at the United Nations Vienna International Centre in Austria. But Why ?
Thank you for staying pith me so far, the next part of my feature sonething of a calculated guess, but if you look at all the evidence so far it may make you ponder !
In April 1986 a terrible accident occurred. Many people died and thousands of others suffered irreversible illness. This accident was the world's yorst nuclear disaster. A reactor at the Chernobyl power station melted down.

The International Atomic Energy Agency is the body which regulates and advises on the peaceful use of nuclear power. It has established a system used to facilitate emergency assistance to member countries in the event of radiation accidents.

The headquarters of the IABA are situated at the Vienna International Centre, Hagramerstrasse 5, P.0. Box 100, 1400, Vienna, Austria.

It is my opinion that the Buzzer is some kind of "status indicator' for the disabled Chernobyl nuclear reactor. What exactly this means is open to comment, but perhaps the signal we hear all the time is simply saying that everything is stable.

You may at this point still be a bit dubious ! Have you heard of the Gama Curtain ? Recent reports have suggested that Russia's nuclear poher stations "posed an unacceptable risk" to safety. Hugh investment was needed to bring then upto western standards. Should another accident like the one at Chernobyl occur, there is as yet a limited capability for tracking the radiation plume.

Enter the "gama curtain" - an early marning and monitoring system in Belarus and Ukraine. Set up at a cost of $£ 3.1$ m pith money from the European Comission Tacis (technical assistance to the CIS), Gamma-1 will be fully operational by mid - 1996.

The gama curtain is similar to systems already in use in the west (more on this in a moment). The system 日ill also give restern Europe an early marning of any accidental releases of radiation. The system is a detection network, with radiation monitors sited around the nuclear stations connected by radio link to local response centres which collect and process the data. Duplicated computer systems at each centre enables operators to monitor the situation continually. However an alarn is automatically raised if present thresholds are breached or any systems malfunction are detected.

All data are sent automatically to two national response centres, one in Kiev and the other in Minsk, via dedicated phone lines. Summary data $\operatorname{dill}$ also be sent to mestern Europe via B - mail on a routine basis and innediately if the situation rarrants it.

Three stations have been selected for phase one. Ignalina in Belarus and Rivne and Zaporizhya in Ukraine.

Chernobyl was not chosen because the severe contamination in the area pould have presented additional complexities for the pilot system.

If we are gnywhere near the truth on this then it opens up a whole area for other 'seemingly point.less' signals. The 'Pip' and the 'Echo' must be candidates for some kind of status function. What about single letter beacons ! Perhaps not all of these are of the same magnitude as the Buzzer but it is well worth thinking about.

Photographs of the Buzzer using a spectrum analyser, thanks to Mike in Kent. Resolution $1 \mathrm{kHz} \backslash D I V$.

BUZZER IN NORHAL MODE

BUZZER IN 'HARBLE" MODB JUST PRIOR TO HOUR.

Information on the gamas curtain with full acknowledgements to Dinah Greek.

Detectora placed at fround level immediately around the plant are not enough as plumes may rise above then. Detectors have been placed high up on buildings for security. Also because plumes may "rain out"and cause serious radiation hot spots well anay from the accident area. Further Geiger Muller counters have been placed in expanding and overlapping rings at distances of upto 20 km from each plant.

Earlier I mentioned that the gamma curtain is similar to systems already in use in the west. The outline of Britain's own early warning system is built around the possibility of a nuclear attack, although these sane systens would seen likely to respond in the event of a nuclear accident.

AHDREY: (Atomic Heapons Detection Recognition and Estination of Yield) would provide warning that an attack was under way and can detect explosions at least seventy miles (120kn) aнаy.

DIADEM : Seisnographic stations and R.P.B.'s system RIMNET would also contribute data.

HANDEL : A signalling systen links the High Wycombe H.Q. with 252 police stations and headquarters throughout Britain. These in turn distribute information onto some 15,000 carrier receivers. When not in use, the warning receivers are turned down but not switched off. Normally, they enit a quiet ticking sound, a sort of nuclear 'all's well'.
In recent years considerable changes have taken place within the warning system ( mainly due to the end of the Cold War). Readers in Britain may have noticed the building of small mini net' stations. These are situated at the side of roads and motorways, they look quite innocent and doubtless anyone asking too many questions pould probably be told that these machines gather weather forecast data ! There is some truth in that, but the main purpose is to gather data in the event of a nuclear attack or accident. Hindspeed and direction is required to determine the path of fallout plumes.
In the event of an attack or accident the United Kingdon Warning and Monitoring Organisation UKHMO mould supplement net office data. Bracknell Weather Centre (Central Forecasting Office) along with 8 Upper Air Stations, are closely involved in providing weather forecasts for military operations. These "mini met" stations provide anrometer - windspeed and direction, and relative humidity readings which are vital for building up a picture of any particular zone if events dictate.
The 'mini net' stations operate on a remote system and data collected fron then is sent over BT lines prabably via the "HANDEL" network. The lines used are those which carry the speaking clock. These use a systen of 'carriers' (the carrier frequency is 72 kHz , far outside the audio range, although modulated by an audio signal) onto ordinary telephone lines, this enables these stations to be cheaply connecied into the system and for data to be received from very remote areas.

He нould appreciate your comments on this feature, remenber that re are making suggestions and not statements about the Buzzer and the like. so please keep sending in information.

ENIGMA ARE DENIED PERMISSION TO USE THE WULLENWEBER DIRECTION FINDING ANTENNA AT MENWITH HILL LISTENING STATION IN NORTH YORKSHIRE ENGLAND.
